

Who can I call to talk about my test results?

The Office of Environmental Health at:

602 364 3118

Toll free: 1 800 367 6412.

For additional information on environmental health matters, please call:

602 364 3118

Toll Free: 1 800 367 6412

This publication can be made available in alternative format. Please call the number listed above.

This pamphlet is funded through a cooperative agreement with the Agency for Toxic Substances and Disease Registry and the Centers for Disease Control and Prevention

What you should know about Arsenic in the groundwater

**Arizona Department
of Health Services**

What is Arsenic?

Arsenic is a naturally occurring metal in soils. Eating foods or drinking water with too much arsenic can cause health problems.

In Arizona, arsenic is present in almost all groundwater supplies. Because private wells are the primary source of water for rural residents of Arizona, making sure the water is free of arsenic is important.

The Office of Environmental Health recommends testing all new wells for arsenic and other primary metals before the water is used for drinking or cooking purposes.

How much arsenic is too much?

It is OK to drink or cook with the water, if the arsenic level is less than 10 parts per billion (ppb) or 0.01 milligrams per liter (mg/L).

Drinking or cooking with water containing more than 10 parts per billion (ppb) or greater than 0.01 milligrams per liter (mg/L) might increase the chance for developing cancer.

Water with 500 parts per billion (ppb) of arsenic or less can be used for bathing, laundry, and brushing teeth.

How can arsenic be removed from the water?

Arsenic can be removed from the water by several methods, but the most common method for household use is by a reverse osmosis filtration system.

Can arsenic be removed by boiling the water?

Arsenic is a metal, and cannot be removed by boiling the water before use. In fact, boiling the water may increase the concentration of arsenic.

How can arsenic hurt me or my family?

Arsenic in small amounts, taken over many years , can cause some types of cancers, with a form of skin cancer

being the most common. In higher concentrations arsenic can cause poisoning, which may result in acute illness and even death.

Why is this information being made available?

Information on arsenic exposures around Arizona have been available for several years. It is only recently that people have begun moving into areas where high arsenic levels may affect large numbers of people. Because of these large numbers, the Office of Environmental Health is providing more detailed information to the public on how to protect themselves.

Other recommended actions for private wells

The Office of Environmental Health recommends that all private wells be tested once per year for bacteriological and nitrate contamination from septic systems.
